Python programming pdf myanmar pdf

Variables are case-sensitive. Keywords are reserved words that have a special meaning in Python and they cannot be used as variable names. Is 0 equal 1?3. It supports Burmese, Karen, Shan and Mon languages. 13//2F. 13/2E. Input and output. 4. Is 100.1 less than 100?>> 100.1 < 100FalseExercisesA. Call it as follows:It will return a list of tokens (tokenized words).Word-level tokenizationOn the other hand, word-level tokenization supports only Burmese. Also, in other languages, such as C/C++, variables must be declared before assigning values to them. These two links are essential references to better understand the fundamentals:Python Programming - Environment SetupDigital Logic Gates (Part 1)Booleans are either True or False.The three logical operators defined on Booleans are:1. (1+2) * 3D. == (equal)2. 2 * 12%5 C. 3.Variables should be lowercase with words separated by underscores as necessary to improve readability. Also, the first figure in this step shows the rules of boolean algebra. If we use function names as variable names, the function will no longer be accessible. Comparison exercises: 1. and 3. For example: homework_grade is not the same as homework_Grade.5. Built-in function names should not be used as variable names. != (not equal)3. Also, tokenization is categorized into syllable-level and word-level.Thanks for reading this piece. not 6 4. Comments and documentation. For example:>>> round(4.123,2)4.12>>> round(6.352,1)6.4>>> round(5.452)5Another useful function in Python is type() which returns the object type.For example:>>> type(5)>>> type (5.1)Exercises:A. Skip to main content Enrollment in this course is by invitation only Python Programming □□□ □□□□□□□□□□□□ □□□□ □□□□□□□□□□ level □□□ □□□□□□□□□□□□□□□□□□□□□□□□□□□□ Programming □□□□□□□□□□□□□□□□□□□□□□□□□□□□□□ □□□□□□□□□□ level □□ □□□□□□□□□□□□□□□□□□□□□□□□□□ □□□□□□□□□□□□□□□□□□ □□□□□□□□□□□□□□□□□□□□□□□□□□ lectures □□□□□□ □□□□□□□□ Videos □□□□ Tests Quizzes Homework □□□□ Projects □□□□□□□□□□□□□□□□ Games □□□ Algorithms □□□ Real World Problems □□□ □□□ Python 3 □□□ □□□□□□□□□□□□□□□□□□ □□□□□□□□□□□□□□□□□□□□□□□□□□□□□□ Section 1 - Course Overview Section 2 - Python Setup Section 3 - Object and Data Structures Section 4 - Comparison Operators Section 5 - Statements Section 6 - Methods and Functions Section 7 - First Project Section 8 - Object Oriented Programming Section 9 - Errors and Exceptions Handling Section 10 - Second Project Section 11 - Modules and Packages Section 12 - Decorators Section 13 - Generators Section 14 - Final Project Advanced Bonus Section □□□□□□□□□□□□□□ 4th year, Robotics & Mechatronics, Yangon Technological University Team Leader at FIRST GLOBAL TEAM MYANMAR Assistance Instructor Sai Htet Moe Swe 4th year, Robotics & Mechatronics, Yangon Technological University This is the second instructable in the Python Programming Series. It is critical to know that the left side of an assignment statement must be a variable name. However, the convention is to use uppercase letters for the names of constants in order to be easily recognized. Useful in Natural Language Processing and text preprocessing for Myanmar language.At the time of this writing, it supports:language detection (Universal Burmese, Zawgyi, Karen, Mon, Shan)conversion between Zawgyi and Unicode texttokenization based on syllable or wordIt is recommended to create a new virtual environment before you continue with the installation.Pip installActivate it and run the following command for the installation:Add the following import statement at the top of the file:Then, you can call the detect function and pass in your desired text:It will return a string indicating the detected Myanmar language. > (strictly greater than)4. For instance:score = 10 is not the same as 10 = score result = False is not the same as False = result Rules about variables:1. 2. I used the interpreter to do some examples and further explore numbers and arithmetic operators as shown in the second figure. The "=" sign is an assignment operator >>> weight == 1False "= =" is a comparison operator, and weight == 1 is equivalent to "Is weight equal to 1?"Also, "weight == 1" is just a comparison expression, and thus it does not change the value of the variable. The list of Python keywords can be shown as follows:>>> import keyword >>> keyword.kwlist ['False', 'None', 'True', 'and', 'as', 'assert', 'break', 'class', 'continue', 'def', 'del', 'elif', 'else', 'except', 'finally', 'for', 'from', 'global', 'if', 'import', 'in', 'is', 'lambda', 'nonlocal', 'not', 'or', 'pass', 'raise', 'return', 'try', 'while', 'with', 'yield']We will get an error if we specify an illegal variable name as seen below:>>> 4score = 10SyntaxError: invalid syntax >>> False = 4SyntaxError: can't assign to keyword>>> amount$ = 50SyntaxError: invalid syntaxUnlike a variable, a constant refers to an identifier whose value is not supposed to change. Strings.2. Conversion functions. or These logical operators are listed in their order of operation as well. Call the tokenize function as usual and specify the form parameter to word.The output is slightly different from the syllable label depending on the input text. round(13.42,1)Note: Please share your answers in the comments section so we can discuss them.Variables are used to refer to information that can change over time. not 0 3. Is 1 a negative number?2. For instance, any non zero value is interpreted as True and zero is interpreted as False.Furthermore, the following comparison operators are supported in Python:1. Have a great day ahead! 3. Floats: 4.0, 5.2, -3.53. For example:>>> score = 10>>> print(score)10>> result = False >>>print(result)False The "=" sign is an assignment operator. Variable names can contain letters, numbers, and underscore characters, but they must begin with a letter or an underscore. >= (greater than or equal)6. 1 and 0B. For example:LENGTH= 100MAX_WEIGHT = 5Explicitly identifying constant in our programs is a good practice because it makes our code more readable and maintainable. As seen in the second figure, I have used the Python interpreter to do some examples in order to understand the function of each logical operator.Examples>>> not True False>>> False and True False >>>True or False True >>> True and not False TrueIt is also important to know that Python has a boolean interpretation for non-boolean values. Based on the official documentation, pyiduangsu is a... Python library for Myanmar language. True and False or True 2. In the next instructable, I will cover:1. It is based on conditional random field (CRF) prediction. Is 4 less than or equal to 1?>> 4
